CLI

```
$ feditest -h
usage: feditest [-h] [-v] {convert-transcript, create-constellation, create-session-template, create-testplan,
info, list-templates, list-nodedrivers, list-tests, run, version} ...

FediTest: test federated protocols

positional arguments:
    convert-transcript  Convert a transcript of a TestRun to a different format
    create-constellation
                        Combine node definitions into a constellation
    create-session-template
                        Create a template for a test session
    create-testplan     Create a test plan by running all provided test sessions in all provided constellations
    info                Provide information on a variety of objects
    list-templates      List the available templates
    list-nodedrivers    List the available drivers for nodes that can be tested
    list-tests          List the available tests
    run                 Run one or more tests
    version             Show feditest version

options:
  -h, --help            Show this help message and exit
  -v, --verbose         Display extra output. May be repeated for even more output
```

Example run

```
$ feditest -v run \
  --filter system2 \
  --node sender_node=nodes/mastodon.ubos.node.json \
  --node receiver_node=nodes/mastodon.ubos.node.json \
  --name 'Mastodon vs Mastodon' \
  --html results/mastodon-mastodon.html
```
